PREFACE	11
ACKNOWLEDGEMENTS	21
CHAPTER 1: BASIC CONCEPTS AND FINDINGS	
1 Introduction	23
1.1 Structural sensitivity to rheological behaviour of concrete.	24
1.2 Connections with the limit state design philosophy	24
1.3 Accuracy levels	26
1.4 Typical problems	27
2 Fundamentals on the prediction of creep and shrinkage	29
2.1 General	29
2.2 Shrinkage.	31
2.3 Creep	32
2.3.1 Basic elements	32
2.3.2 Description of various prediction models.	39
2.3.2.1 Definitions	39
2.3.2.2 Prediction models	41
A) CEB 1978.	41
B) ACI 209	44
C) CEB 1970	45
D) Bazant-Panula (BaP)	47
2.3.3 Final remarks	49

3	The structural analysis problem	52
3.1	General	52
3.2	Uniaxial stress-strain relations for concrete	53
3.2.1	Basic assumptions	53
3.2.2	Integral-type creep law (superposition equation for uniaxial prescribed stress)	54
3.2.3	Integral-type relaxation law (superposition equation for uniaxial prescribed strain)	55
3.2.4	Discussion of integral-type creep and relaxation laws.	56
3.2.5	Rate-type laws	61
3.3	Multiaxial stress-strain relations for concrete	61
3.3.1	Basic assumptions	61
3.3.2	Stress-strain relations	62
3.4	Application to structures	62
3.4.1	Classification of structures	63
3.4.2	Homogeneous structures with rigid restraints and with linear creep properties. First and second principle of linear viscoelasticity.	64
3.4.3	Other types of structures	68
3.4.3.1	General	68
3.4.3.2	Homogeneous structures with elastic restraints under constant sustained loads: condition of invariance of the state of stress	70
3.4.4	Conclusions	71

CHAPTER 2: PRACTICAL METHODS FOR STRUCTURAL PROBLEMS

1	Introduction	73
2	General numerical step-by-step procedures (General method)	75
2.1	Introduction	75
2.2	Step-by-step determination of the stress response to a given strain history	76
2.3	Recurrent algebraic formulae.	79
2.4	Determination of the relaxation function $r(t, \tau)$ from the creep function $\Phi(t, \tau)$	80

2.5	Computer program	81
2.6	Observations	81
2.6.1	Subdivision of time by discrete intervals	81
2.6.2	Computation of creep values and storing of stress history	82
2.7	Applications	83
2.7.1	Variable strain history (restrained shrinkage)	83
2.7.2	Determination of the relaxation function corresponding to the creep function of CEB 1978 creep model	83
2.7.3	Application to the analysis of structures; homogeneous and non-homogeneous structures	83
2.8	Step-by-step determination of the strain response to a given stress history by the integral-type relaxation law	84
2.9	Step-by-step algorithms based on rate-type constitutive laws	84
3	Simplified methods	86
3.1	Algebraic methods	86
3.1.1	Effective modulus method (EM)	87
3.1.1.1	Case with variable E_c	87
3.1.1.2	Case with constant E_c	87
3.1.1.3	Observations on the application	88
3.1.2	Mean stress method (MS)	91
3.1.2.1	Case with variable E_c	92
3.1.2.2	Case with constant E_c	92
3.1.2.3	Observations on the application	93
3.1.3	Age adjusted effective modulus method (AAEM)	94
3.1.3.1	General	94
3.1.3.2	Determination of the aging coefficient $\chi(t, t_0)$ for creep and relaxation problems and for their linear combinations	96
3.1.3.3	Approximate generalization to other types of problems	99
3.1.3.4	Application to typical problems	100
3.1.3.5	Observations on the application	101
3.1.3.6	Example of application: restrained shrinkage	103
3.1.4	Discussion of algebraic methods	104

3.1.4.1	Relative significance of different approximations.	104
3.1.4.2	Correlations with the general algebraic expression (2-34) (e-13) of the superposition equation and conclusions	110
3.1.4.3	Application to the relaxation problem.	113
3.2	Simplified creep methods	117
3.2.1	General	117
3.2.2	Improved Dischinger method (ID)	119
3.2.2.1	Creep law	119
3.2.2.2	The fundamental differential equation	120
3.2.2.3	Application to typical problems	122
3.2.2.4	Homogeneous structures with rigid restraints; relaxation problem. . . .	122
3.2.2.5	Homogeneous concrete structures with additional elastic restraints . . .	127
3.2.2.5.1	Introductory remarks	127
3.2.2.5.2	Application: single additional elastic restraint	128
3.2.2.5.3	Summary of formulations for the improved Dischinger method	135
	1) Constant imposed deformation to the additional elastic restraint	136
	2) Change of statical system: elastic restraint introduced after the loads (retarded elastic restraint)	136
	3) Permanent loads applied to the concrete structure after the introduction of the additional elastic restraint	138
	4) Gradually imposed stress-independent deformation (linearly related to the flow coefficient)	140
3.2.2.5.4	Example fo application: effect of shrinkage	140
3.2.2.5.5	Observations	141
3.2.3	Theory of heredity (non-aging concrete)	142
3.3	Approximate algebraic determination of the relaxation function ($\tilde{r}$ method) .	144
3.3.1	Formulation of the method	144
3.3.2	Observations on the application	146
4	Direct use of the relaxation function for homogeneous structures with rigid restraints	151
4.1	Variable applied forces or geometric actions	152
4.2	Constant applied forces of geometric actions	152
4.3	Combined problems	152

4.4	Typical problems	152
4.4.1	Variable imposed displacements linearly related to the creep coefficient $\varphi_{2a}(t, t_0)$	152
4.4.2	Example of application: restrained shrinkage	154
4.4.3	Structures under constant sustained loads subjected to a modification of restraint conditions	154
4.4.3.1	Additional restraints introduced immediately after the loads ($t_1 = t_0^+$)	155
4.4.3.2	Additional restraints introduced at time $t = t_1 > t_0$	158
5	Example of application of different methods to a typical structural problem (restrained shrinkage)	161

CHAPTER 3: APPLICATION OF SELECTED METHODS TO DIFFERENT STRUCTURAL PROBLEMS

1	Introduction	165
2	Creep data for the structural analysis	168
3	Homogeneous structures	172
3.1	Relationships between forces and displacements in homogeneous structures	172
3.2	Homogeneous structures with rigid restraints	175
3.2.1	General	175
3.2.2	Imposed loads	175
3.2.2.1	Imposed loads that are constant or variable in steps	175
3.2.2.2	Variable loads	176
3.2.3	Imposed deformations	177
3.2.3.1	Application of the second principle of linear viscoelasticity	177
3.2.3.2	Use of the creep functions	181
3.2.3.3	Variable imposed deformations linearly related to the creep coefficient	182
3.2.4	Homogeneous structures subjected to a modification of restraint conditions	183
3.3	Homogeneous structures with elastic restraints	186
3.3.1	General	186

3.3.2	Application of the general method	187
3.3.3	Application of the algebraic methods	188
3.3.3.1	Example	189
3.3.4	Application of the simplified creep methods: Improved Dischinger method .	193
3.3.5	Structures with a single elastic restraint. Discussion of different approaches	197
3.3.5.1	Algebraic methods	198
3.3.5.2	Improved Dischinger method	201
3.3.5.3	General method	202
3.3.5.4	Conclusions	203
3.3.6	Constant sustained loads: conditions of invariance of the state of stress	204
4	Creep behaviour of heterogeneous sections	206
4.1	General	206
4.2	Uncracked reinforced or prestressed sections with one degree of internal statical indetermination (one internal elastic restraint)	207
4.2.1	Application of the algebraic methods	208
4.2.2	Application of the Improved Dischinger method	213
4.3	Uncracked sections with more than one degree of internal statical indetermination (internal elastic restraints)	217
4.3.1	Algebraic methods	217
4.3.2	General numerical method	225
4.4	Sections including different type concrete portions	226
5	Structures characterized by heterogeneities along their axis and/or within the sections	229
5.1	General	229
5.2	Statically determinate structures	229
5.3	Statically indeterminate structures	230
5.3.1	Structures consisting of homogeneous segments with characteristics that vary along the axis	231
5.3.2	Structures consisting of heterogeneous sections	232
